***Symposium on 21st Century
Teaching Technologies:***
A Continuing Series of Explorations
March 24, 2000

*Development of Web-Based Courses:
A Software Engineering Approach*

Jonás Montilva
University of South Florida
College of Engineering
Department of Computer Science & Engineering
Tampa, FL

Contents of the presentation

- Motivation
- Objectives of the research
- Research methodology
- Main results
 - **A conceptual of a web-based course**
 - **A method for developing web-based courses**
- Conclusions

- There many software tools for creating web-based courses
 - **E.g., CourseInfo and WebCT**
- But there are very few methods that explain how to create a high quality and effective web-based course
- Using a tool must be preceded by more important activities, such as:
 - **The analysis of instructional requirements**
 - **The design of the content, structure, interaction, and interface of the course**

Research objectives

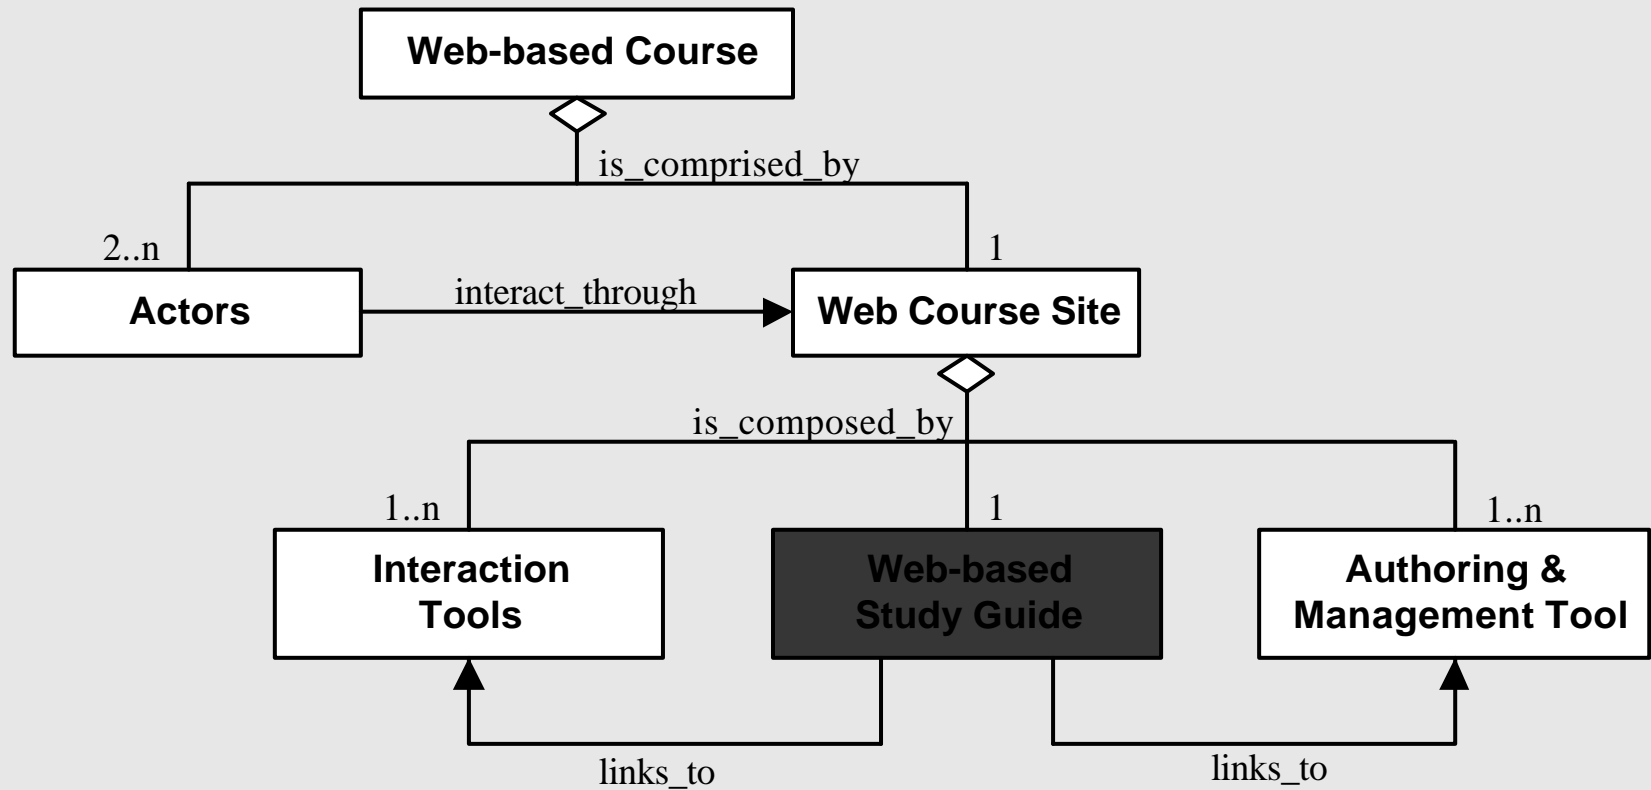

- To demonstrate that Software Engineering could be successfully applied to the development of web-based courses.
- This hypothesis was proven by:
 - **building a software engineering based method for developing web-based courses**
 - **using the method to create several web-based courses**

- An integration process was applied to design the method
- We integrated principles, models, and methods from:
 - **Instructional System Design**
 - **Hypermedia**
 - **Object-Oriented Software Engineering**
- A conceptual model of web-based courses was created first
 - **It provided a conceptual framework for designing the method**

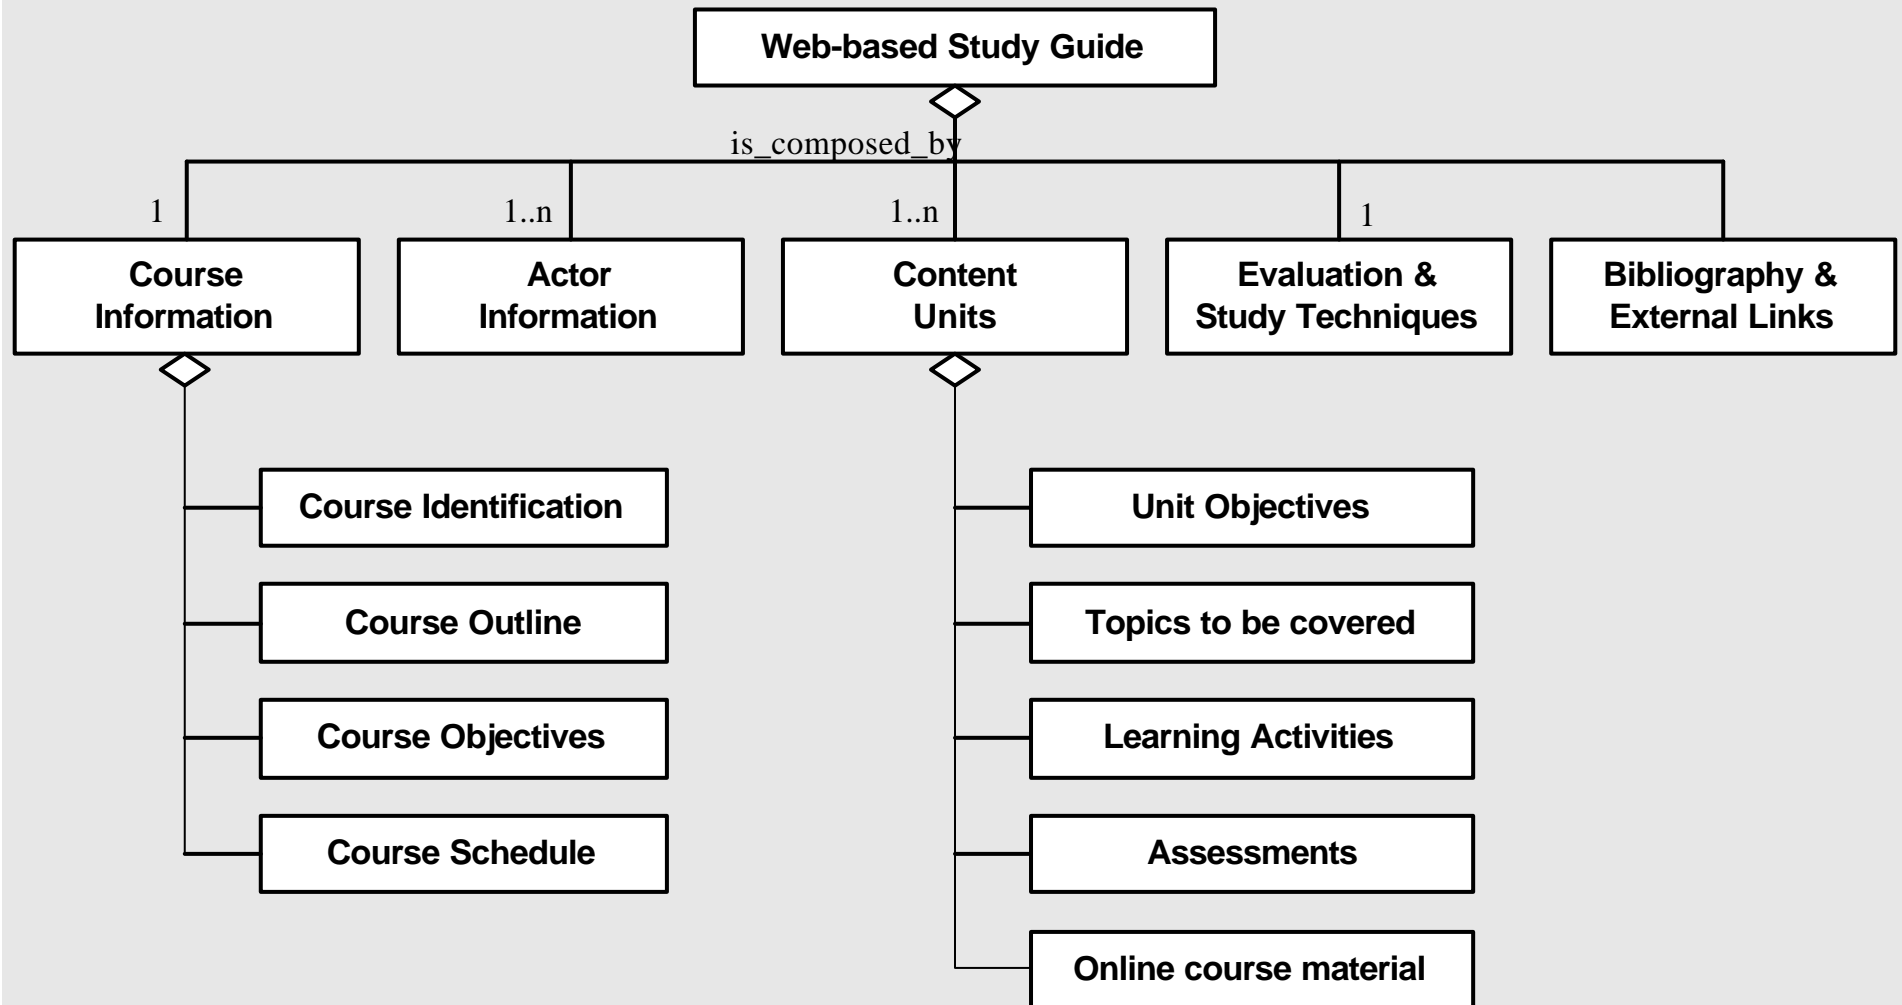

Web-based courses: a definition

- A web-based course is an online course that applies the WWW technology to facilitate a teaching-learning process
- Key features:
 - **Provides content, information, and directions through web pages**
 - **Facilitates three forms of interaction:**
 - student- instructor
 - student-content
 - student-student
 - **Provides access to collaborative tools for facilitating the interaction**
 - E.g., E-mail, videoconference, discussion lists, chat, electronic whiteboards, etc.

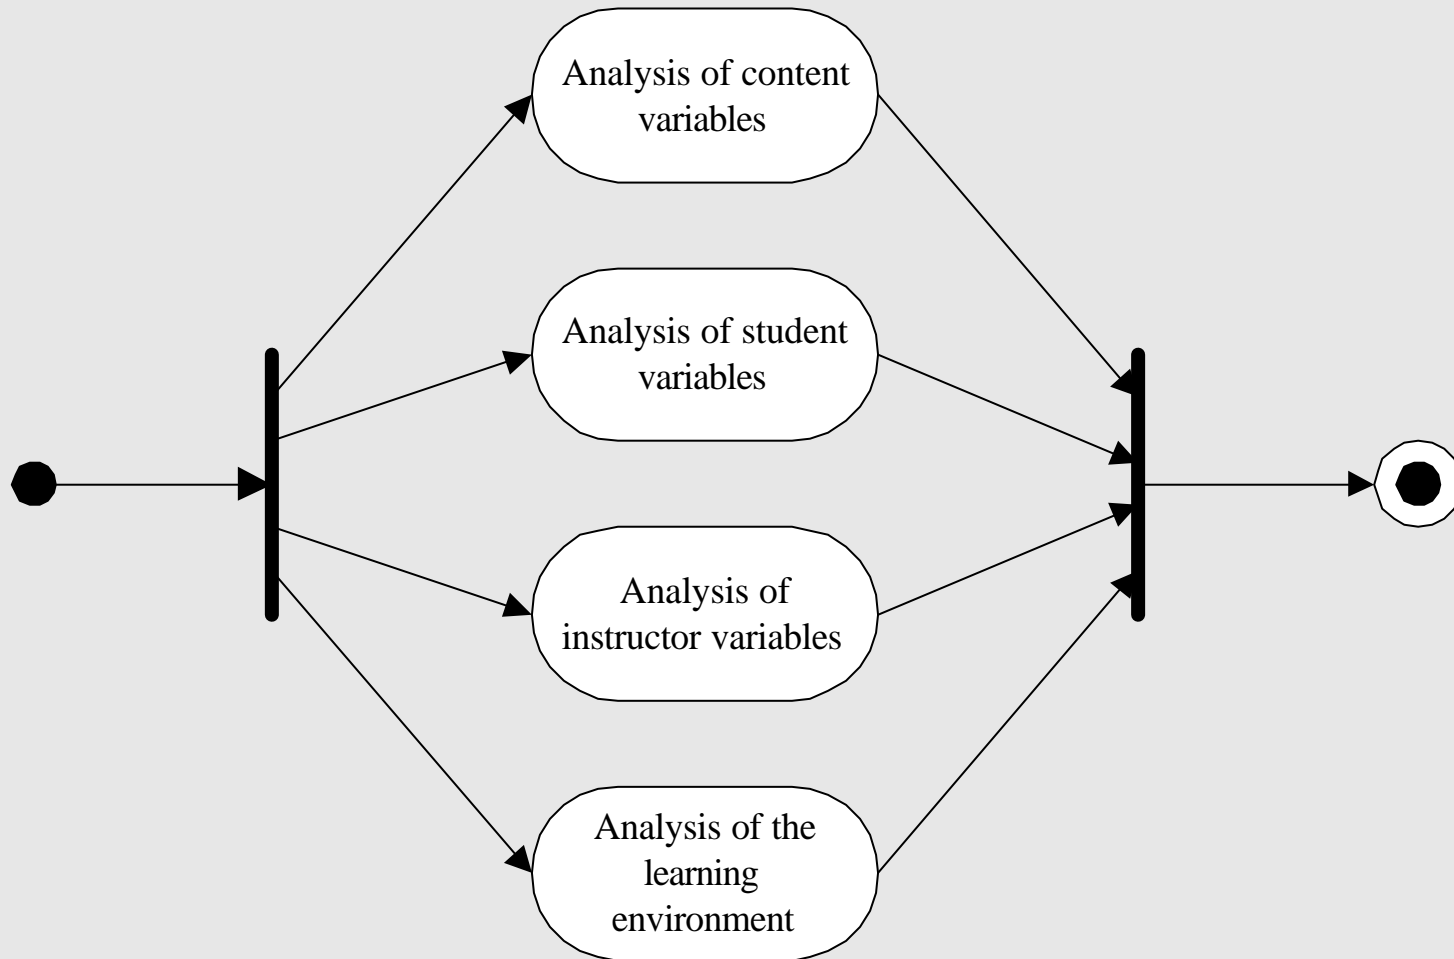

A conceptual model of a web-based course

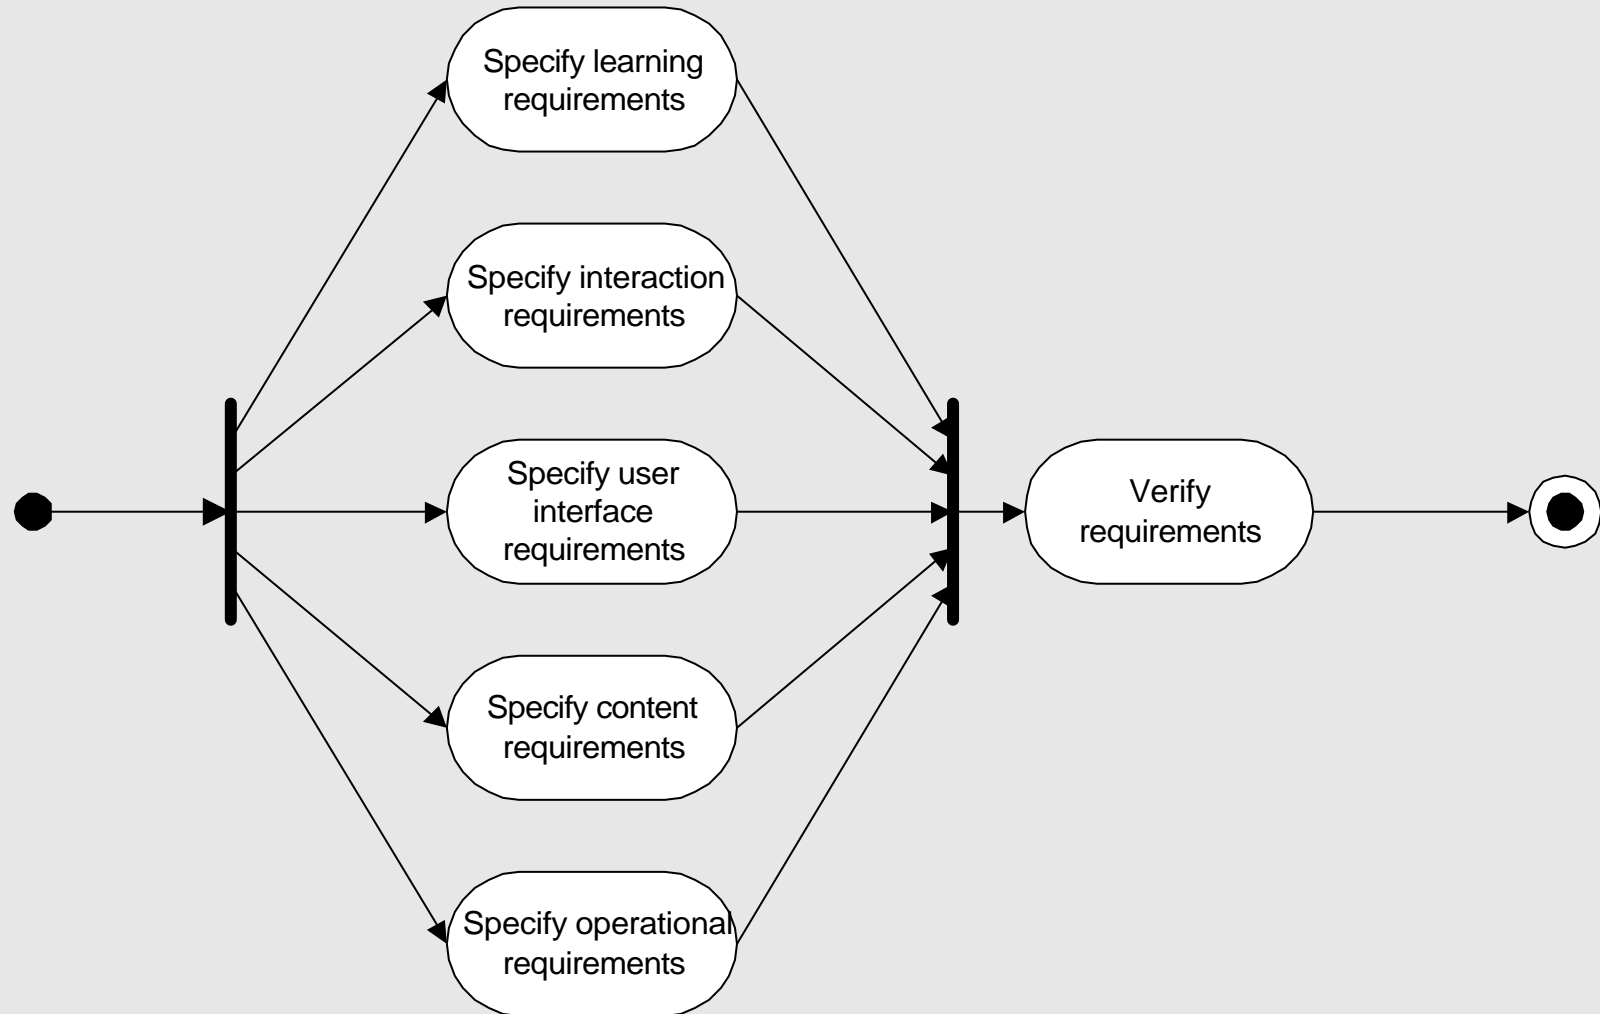

A conceptual model of a web-based course

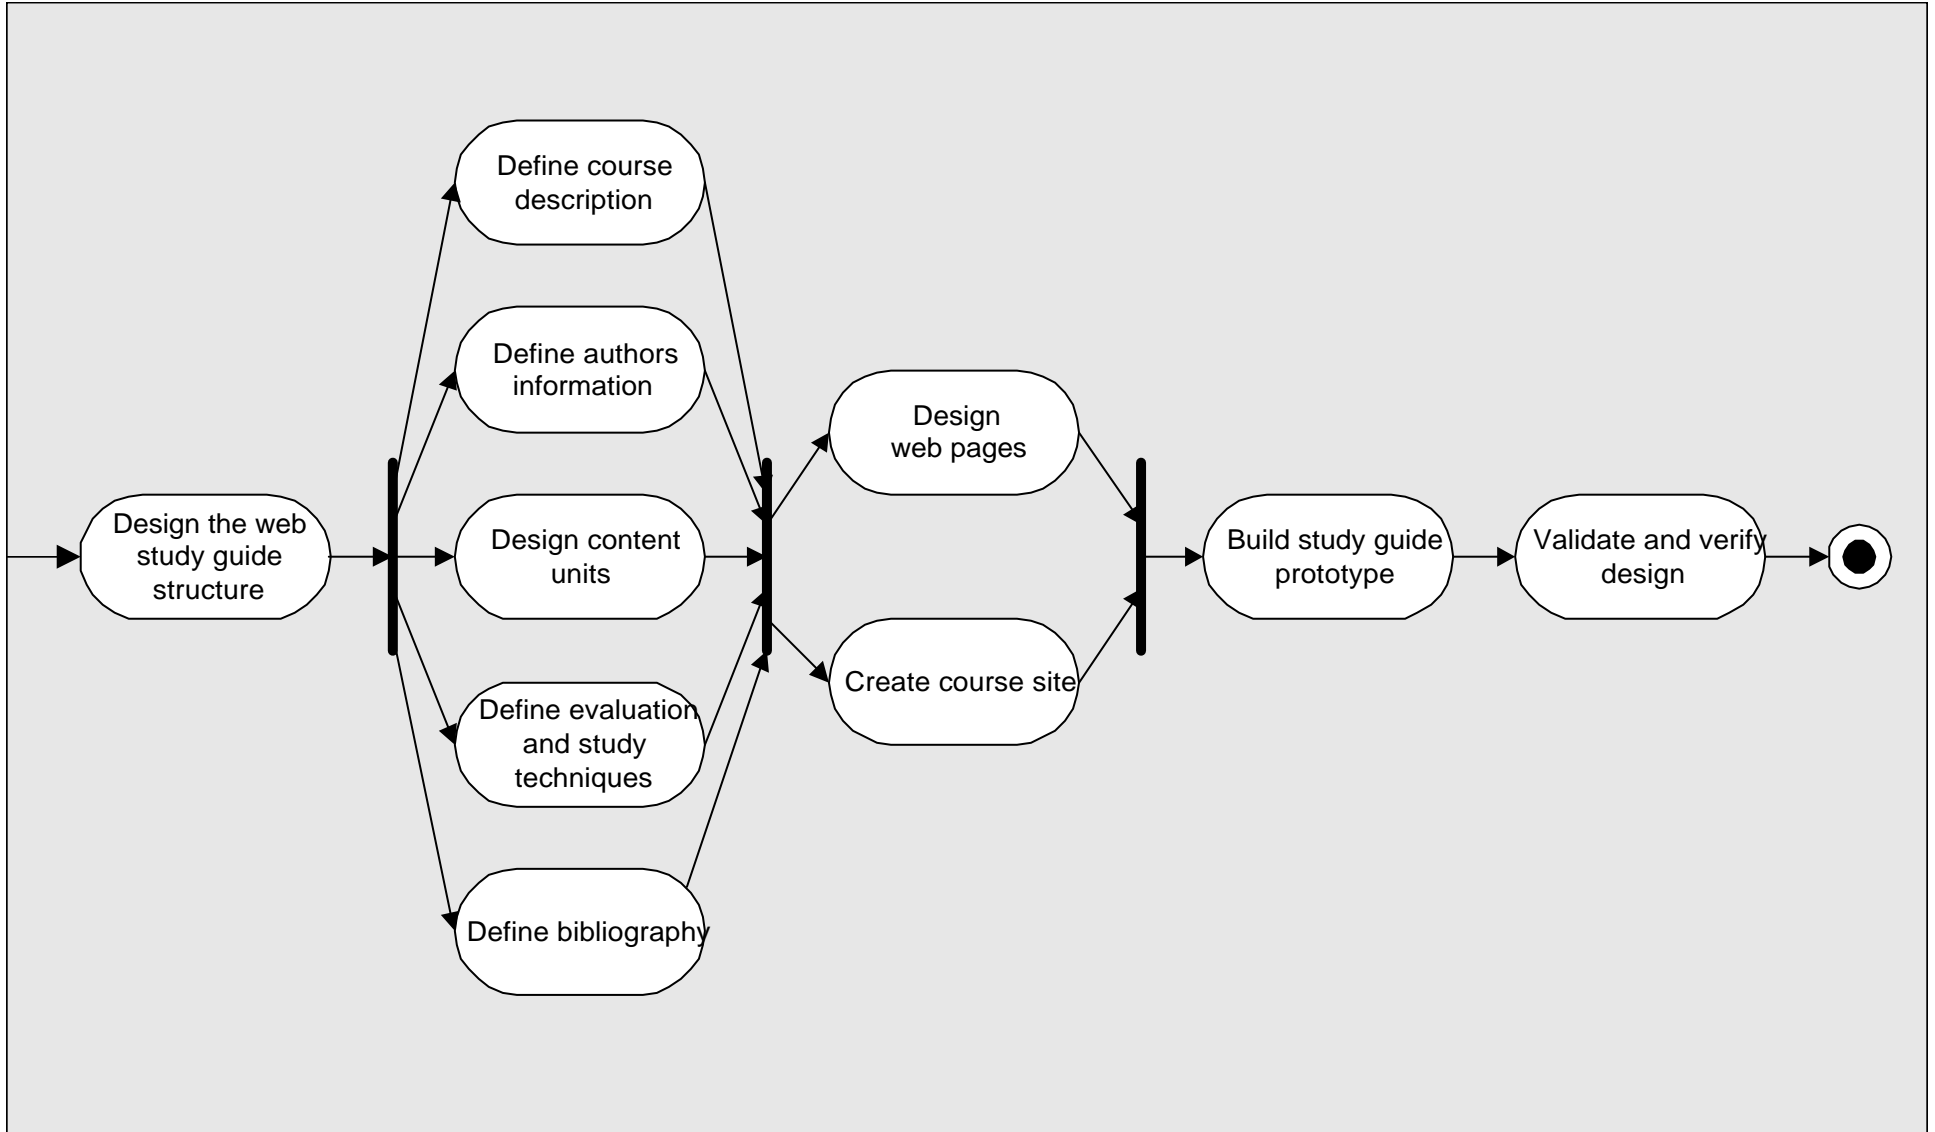

Domain Analysis Phase

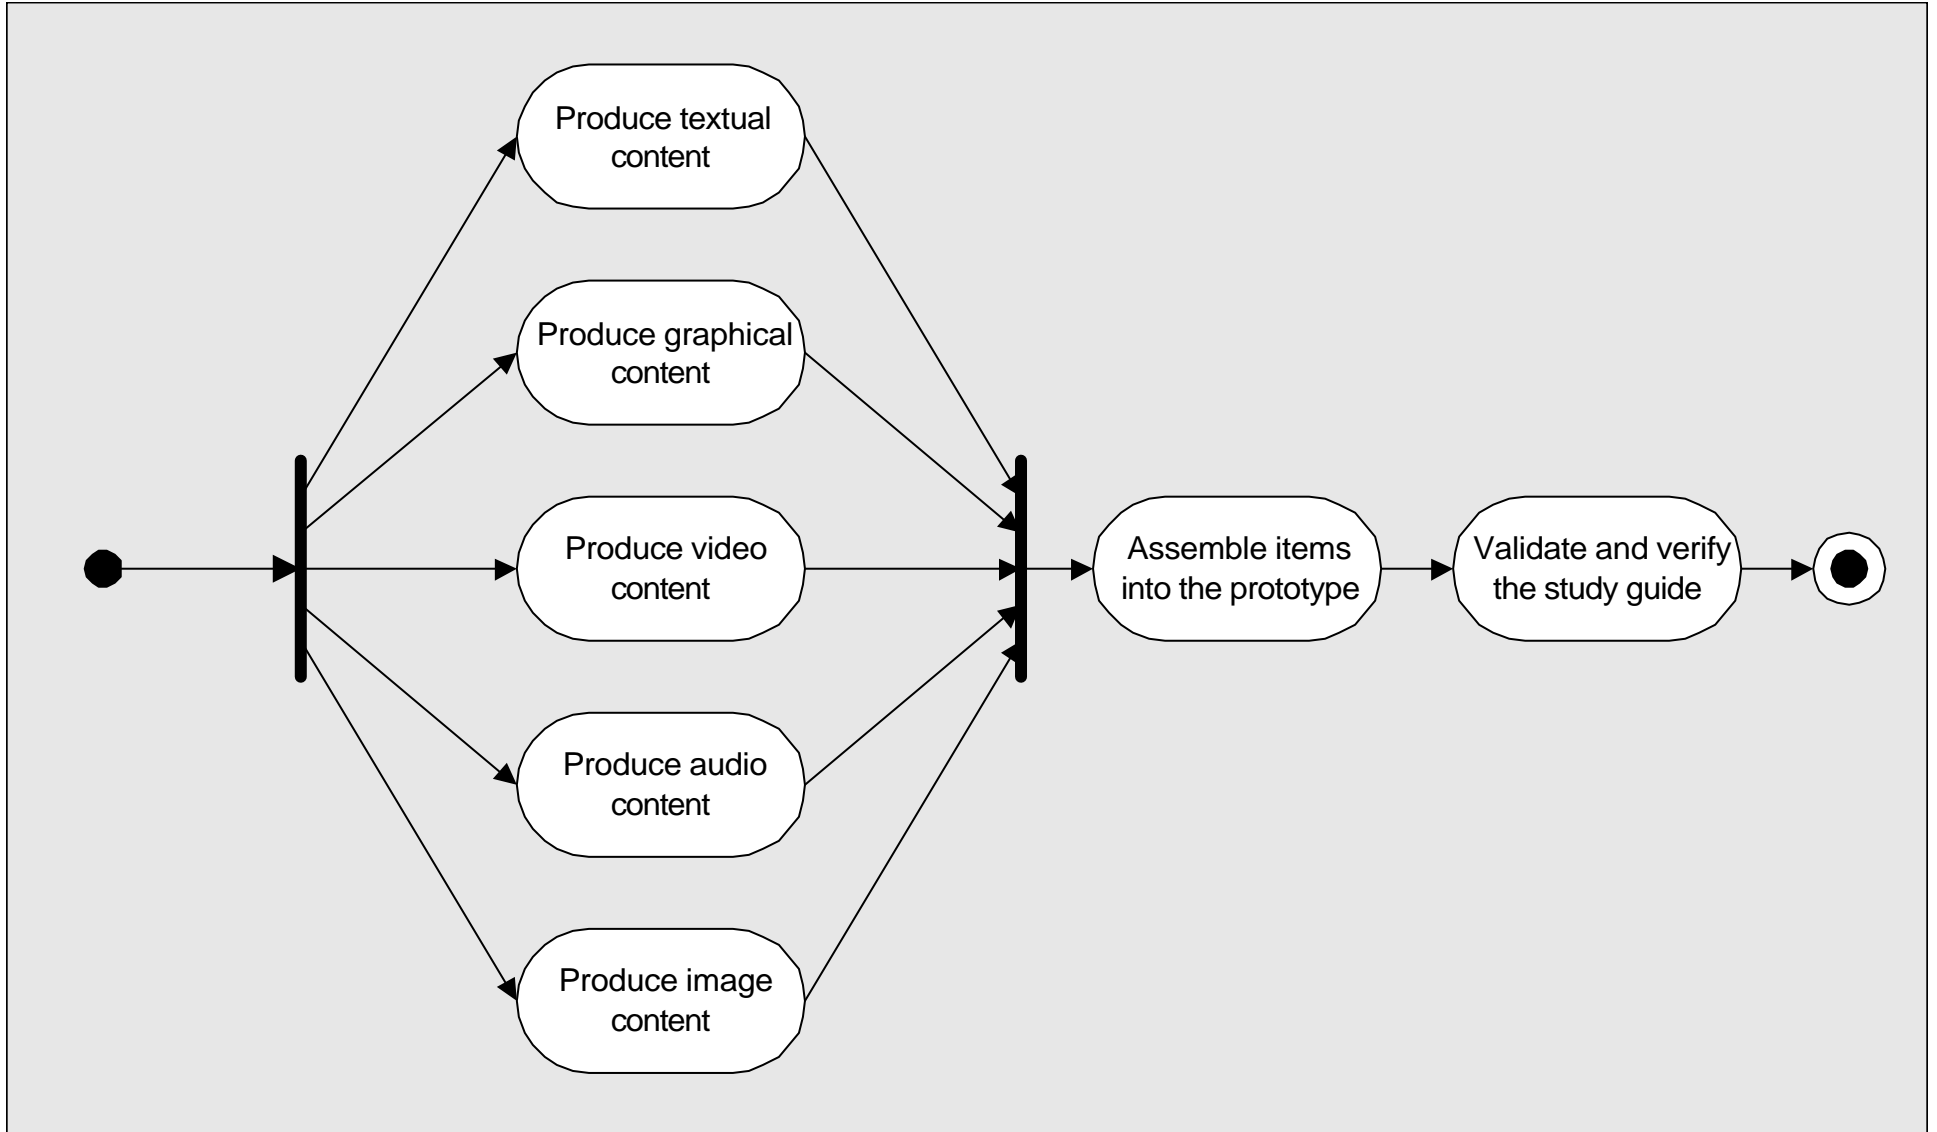

Requirements Definition Phase

Study Guide Design Phase

Production Phase

- The method was tested by developing three web-based courses:
 - **A distance learning course in Software Engineering**
 - www.centauro.ing.ula.ve/isoo
 - **A campus-based course on Software Engineering**
 - www.csee.usf.edu/montilva/cen4020-002/cen4020.html
 - **A campus-based course on Software Design Methods**
 - www.csee.usf.edu/montilva/cis4930/cis4930.html

- The method provides a well-structured and detailed guide to develop web-based courses
 - **It helps the course developers to organize, plan and control the development process**
 - **It covers all the activities involved in the development process:**
 - analysis, specification, design, production and delivery of a web-based course.
- The method contributes significantly to increase the quality and effectiveness of web-based courses
